

This paper examines the embodiment of cisgender subjects in the reality television series *Love Is Blind* (2020-present) through the lens of Trans Studies. It argues that participants in *Love Is Blind*—while firmly anchored in cisnormative frameworks—temporarily experience a form of bodily dissonance where physical touch becomes spectral, overdetermined, and feared. To analyze this sensory fracture, I train small-scale language models (SLMs) on transcripts from the show, using them as predictive instruments to surface shared linguistic and affective patterns around the body and touch. By mobilizing machine learning as a critical, non-extractive method, this project reframes prediction as a tool for studying normativity—demonstrating how cis participants’ attachments to bodily integrity echo trans theoretical concerns with materiality, coherence, and desire.
